2.13. outer automorphism

We do something very elementary but tricky, and will later find out its connection to the advanced topic, like Teichmüller space.

1. outer automorphism group $\text{Out}(G)$ / automorphism group $\text{Aut}(G)$

Ref:

https://en.wikipedia.org/wiki/Outer_automorphism_group

https://en.wikipedia.org/wiki/Automorphisms_of_the_symmetric_and_alternating_groups

Def. Let G be a group. We have a LES

$$1 \longrightarrow Z(G) \longrightarrow G \xrightarrow{\text{conj}} \text{Aut}(G) \longrightarrow \text{Out}(G) \longrightarrow 1$$

where $Z(G)$ is the center of G

$\text{Aut}(G)$ is the automorphism of G

$\text{Inn}(G) := \text{Im}(\text{conj})$ is the inner automorphism of G

$\text{Out}(G) := \text{Aut}(G) / \text{Inn}(G)$ is the outer automorphism of G .

E.g. $G = \mathbb{Z}$, $\text{Aut}(\mathbb{Z}) = \{\pm 1\}$, $\text{Out}(\mathbb{Z}) = \{\pm 1\}$

$G = \mathbb{Z}/m\mathbb{Z}$, see <https://zhuanlan.zhihu.com/p/97195375> ← typo: $\mathbb{Q} \Rightarrow \mathbb{Z}$

$(m \geq 2)$

an easy result is that $\# \text{Out}(\mathbb{Z}/m\mathbb{Z}) = \varphi(m)$.

E.g. $G = S_n$,

$$\text{Aut}(S_n) = \begin{cases} S_n & n \neq 2, 6 \\ \{*\} & n = 2 \\ S_n \rtimes \mathbb{Z}/2\mathbb{Z} & n = 6 \end{cases}$$

$(n \in \mathbb{N}_{>0})$

$$\text{Out}(S_n) = \begin{cases} \{*\} & n \neq 6 \\ \mathbb{Z}/2\mathbb{Z} & n = 6 \end{cases}$$

$G = A_n$

$$\text{Aut}(A_n) = \begin{cases} S_n & n \neq 2, 3, 6 \\ \{*\} & n = 2 \\ \mathbb{Z}/2\mathbb{Z} & n = 3 \\ S_n \rtimes \mathbb{Z}/2\mathbb{Z} & n = 6 \end{cases}$$

$$\text{Out}(A_n) = \begin{cases} \mathbb{Z}/2\mathbb{Z} & n \neq 2, 3, 6 \\ \{*\} & n = 2 \text{ or } 3 \\ \mathbb{Z}/2\mathbb{Z} \oplus \mathbb{Z}/2\mathbb{Z} & n = 6 \end{cases}$$

For a reference of the proof and constructions of the exotic outer automorphism of S_6 , see wiki and here:

<https://wordpress.nmsu.edu/pamorand/files/2018/10/AutGroups.pdf>

For Chinese you can also see here: <https://zhuanlan.zhihu.com/p/24764617>

They are elementary and everybody who have learned something about Sylow's theorem should be able to follow the proofs.

{ elements in conj class $\begin{bmatrix} 1 & & \\ & 1 & \\ & & 1 \end{bmatrix} = (123) \}$

exotic automorphism

E.g. $G = \text{PSL}(2, \mathbb{F}_7) \cong \text{GL}(3, \mathbb{F}_2)$
 $\text{Aut}(\text{PSL}(2, \mathbb{F}_7)) \cong \text{PGL}(2, \mathbb{F}_7)$ $\text{Out}(\text{PSL}(2, \mathbb{F}_7)) \cong \{\pm 1\}$

Statement:

<https://mathoverflow.net/questions/348440/what-is-the-outer-automorphism-group-of-operatornamesl2-mathbbf-q>

For the other lie group, e.g. group in wiki: https://en.wikipedia.org/wiki/Projective_linear_group,

there is a general theory for its outer automorphism group, please see this book: (Even though I'm not so interested now)

<https://www.cambridge.org/core/journals/canadian-journal-of-mathematics/article/automorphisms-of-finite-linear-groups/16c23F257E0F21D57873B1450E9F15E4>

E.g. $F_n :=$ free group generated by a_1, \dots, a_n
 $F_n \rightarrow F_n/[F_n, F_n] \cong \mathbb{Z}^n \quad \leadsto \quad \text{Out}(F_n) \rightarrow \text{GL}(n, \mathbb{Z})$
 It's claimed that $\text{Out}(F_2) \cong \text{GL}(2, \mathbb{Z})$.

Left: f.g. abelian group, like \mathbb{Z}^n . ($\text{Aut}(\mathbb{Z}^n) \cong \text{Out}(\mathbb{Z}^n) \cong \text{GL}(n, \mathbb{Z})$)
 $(\mathbb{Z}/8\mathbb{Z})^{\oplus 3}$
