- 5 Euler class

# 1. notations and warnings

In this document,

$$\begin{array}{lll} GL_2 = GL_2(\mathbb{C}) & T = \begin{pmatrix} * & 0 \\ 0 & * \end{pmatrix} \subset GL_2 & B = \begin{pmatrix} * & * \\ 0 & * \end{pmatrix} \subset GL_2 \text{ or } SL_2 \\ SL_2 = SL_2(\mathbb{C}) & \mathbb{C}^\times = \begin{pmatrix} * & 0 \\ 0 & * \end{pmatrix} \subset SL_2 & \mathbb{P}^1 = \mathbb{P}^1(\mathbb{C}) \end{array}$$

$$K_0^G(X) := k_0(\text{Coh}^G(X))$$

$$R(G) := K_0^G(\text{pt}) = \text{Rep}(G)$$

$$K_0^G(X)_I^\wedge := \varprojlim_n K_0^G(X)/I^n$$

$$H_G^*(X; \mathbb{Q}) := H^*(EG \times^G X; \mathbb{Q})$$

$$S(G) := H_G^*(\text{pt}; \mathbb{Q}) = H^*(BG; \mathbb{Q})$$

$$HP_G^0(X; \mathbb{Q}) := \prod_{n=0}^{\infty} H_G^n(X; \mathbb{Q}) = H_G^*(X; \mathbb{Q})_I^\wedge$$

To avoid confusion, we don't consider any convolution structure in this document.

we don't consider  $G \times \mathbb{C}^\times$ -action either

( $\mathbb{C}^\times$  is already occupied as a maximal torus of  $SL_2$ )

## 2. result

This time we are not so ambitious. For example, we don't fill in  
 $K_0^B(\mathcal{B} \times \mathcal{B}) \cong K_0^G(\mathcal{B} \times \mathcal{B} \times \mathcal{B}) \cong R(T) \otimes_{R(G)} R(T) \otimes_{R(G)} R(T)$

just because the result is too long.

We don't want to use these symbols (like  $x, y, z$ ) in later documents either. If you want to fix a notation, please use the notations in [https://github.com/ramified/personal\\_handwritten\\_collection/blob/main/weeklyupdate/2022.10.23\\_notation\\_K%5EG\(St\).pdf](https://github.com/ramified/personal_handwritten_collection/blob/main/weeklyupdate/2022.10.23_notation_K%5EG(St).pdf)

### 3. computation of completion in practice

Thm (cpl of Noetherian ring by power series)

$R$ : Noetherian  $I := (a_1, \dots, a_n) \triangleleft R$ , then

$$\begin{aligned}\hat{R}_I &:= \varprojlim_n R/I^n \\ &\cong R[[x_1, \dots, x_n]] / (x_1 - a_1, \dots, x_n - a_n) \\ &\cong R[[a_1, \dots, a_n]]\end{aligned}$$

Ex.  $\hat{\mathbb{Z}}_{(x)} \cong \mathbb{Z}[[x]]$

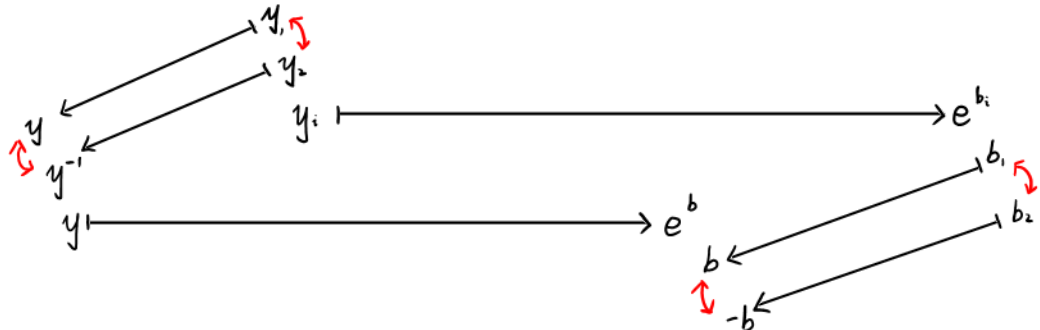

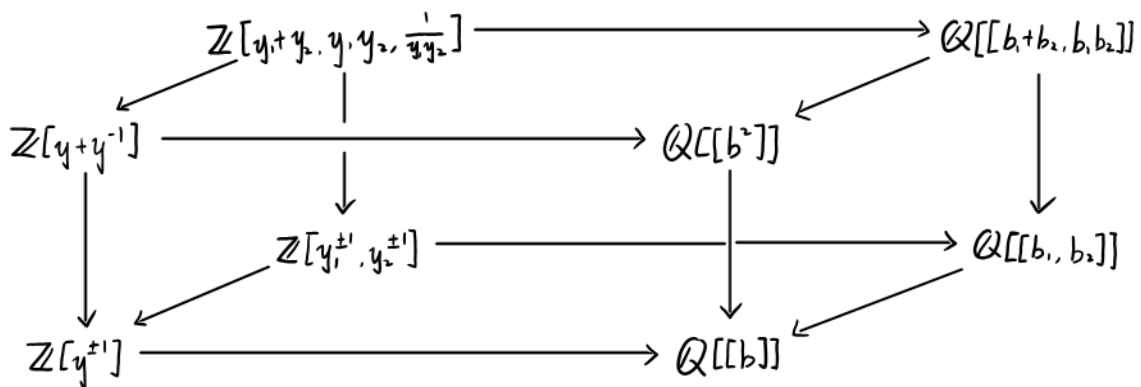

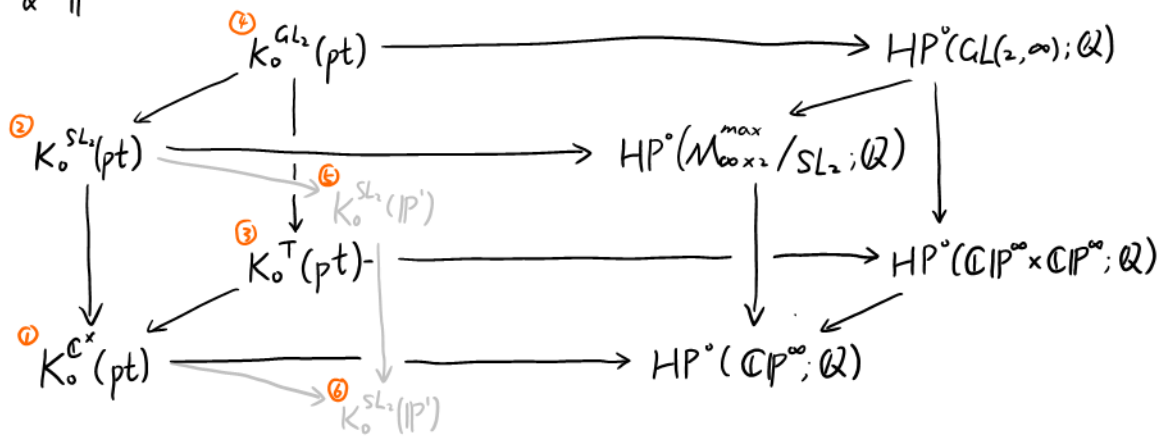

$$\hat{\mathbb{Z}}_{(p)} \cong \mathbb{Z}[[x]] / (x-p) \xrightarrow{\sim} \mathbb{Z}_p$$

$$x \longmapsto p$$

$$\hat{\mathbb{Z}}_{(p^2)} \cong \mathbb{Z}_p$$

$$\hat{\mathbb{Z}}_{(n)} \cong \prod_{\substack{p|n \\ \text{prime}}} \mathbb{Z}_p$$

4. pt & IP'

$\leftrightarrow$ : Weyl group action

Later,  $\mathbb{Q}_i = \mathbb{Q}_i^G$  is a temporary notation.

$ch^*$  is iso after tensored over  $\mathbb{Q}$ .

$$(ch^*)^{-1}: HP^*(BG; \mathbb{Q}) \xrightarrow{\sim} K_0(BG) \otimes_{\mathbb{Z}} \mathbb{Q}$$

$$HP_a^*(X; \mathbb{Q}) \xrightarrow{\sim} K_0^G(X) \otimes_{\mathbb{Z}} \mathbb{Q}$$

When I write the inverse map  $(ch^*)^{-1}$ , remember that the image usually has coefficient in  $\mathbb{Q}$ .

## 5. Euler class

At first glance, Chern class seems to be an exponential map.

Actually, Chern class induces ring isomorphism  $(+ \rightarrow +, x \rightarrow x)$

At first glance, Euler class seems to be a termwise  $-\log$  map.  $(x \rightarrow +)$

Actually,

in one monomial

$$1 + eu(\mathcal{L}_1 \otimes \mathcal{L}_2) = (1 + eu \mathcal{L}_1)(1 + eu \mathcal{L}_2) \quad x \rightarrow (1+x)^x$$

for sum among monomials,

$$eu(E_1 \oplus E_2) = eu(E_1)eu(E_2) \quad + \rightarrow x$$

Let us see some examples of Euler class.

E.g.

$$\begin{array}{ccc} K_0^{GL_n}(\mathcal{B}) & \longrightarrow & HP_{GL_n}^0(\mathcal{B}; \mathbb{Q}) \supset H_{GL_n}^*(\mathcal{B}; \mathbb{Q}) \\ \mathbb{Z}[y_1^{\pm 1}, \dots, y_n^{\pm 1}] & \longrightarrow & \mathbb{Q}[[b_1, \dots, b_n]] \supset \mathbb{Q}[b_1, \dots, b_n] \end{array}$$

$$\begin{array}{ccc} y_i & \xrightarrow{\quad} & e^{b_i} \\ \downarrow & \searrow & \swarrow \log(\cdot)^{-1} \\ y_i^{-1}(1-y_i) \text{ or } 1-y_i & & -b_i \end{array}$$

$\log y_i^{-1} = \log(1 + (y_i^{-1} - 1)) \approx y_i^{-1} - 1 \quad \text{or} \quad -\log y_i = -\log(1 + (y_i - 1)) \approx 1 - y_i$   
 $\approx y_i^{-1}(1-y_i)$

$$\begin{array}{ccc} \prod_i y_i^{k_i} & \xrightarrow{\quad} & e^{\sum k_i b_i} \\ \downarrow & \searrow & \swarrow \\ (\prod_i y_i^{-k_i})(1 - (\prod_i y_i^{k_i})) \text{ or } 1 - (\prod_i y_i^{k_i}) & & -\sum k_i b_i \end{array}$$

$$\begin{array}{ccc} \frac{y_2}{y_1} + \frac{y_3}{y_1} + \frac{y_3}{y_2} & \xrightarrow{\quad} & e^{b_2-b_1} + e^{b_3-b_1} + e^{b_3-b_2} \\ \downarrow & \searrow & \swarrow \\ (1 - \frac{y_2}{y_1})(1 - \frac{y_3}{y_1})(1 - \frac{y_3}{y_2}) & & (b_1-b_2)(b_1-b_3)(b_2-b_3) \end{array}$$

Q: What is right definition of  $eu(\mathcal{T})$ ?

$$eu(\mathcal{T}) = \sum_{i=0}^{+\infty} (-1)^i [\Lambda^i \mathcal{T}]^*$$

$$eu\left(\frac{y_2}{y_1}\right) = 1 - \frac{y_1}{y_2}$$

compatible with Euler characteristic:

$$e(X) = \sum_{i=0}^{+\infty} (-1)^i H^i(X; \mathbb{Q})$$

will induce

$$D_i f = sf D_i + \frac{f - sf}{1 - \frac{e_i}{e_{i+1}}}$$

$$\left(\frac{e_i}{e_{i+1}} D_i\right) f = sf \left(\frac{e_i}{e_{i+1}} D_i\right) - \frac{f - sf}{1 - \frac{e_i}{e_{i+1}}}$$

$$D_i \left(\frac{e_i}{e_{i+1}} f\right) = sf D_i \left(\frac{e_i}{e_{i+1}} g\right) - \frac{f - sf}{1 - \frac{e_{i+1}}{e_i}} g$$

or

$$eu(\mathcal{T}) = \sum_{i=0}^{+\infty} (-1)^{i+1} [\Lambda^i \mathcal{T}] ?$$

$$eu\left(\frac{y_2}{y_1}\right) = \frac{y_1}{y_2} - 1 = \frac{y_1}{y_2} \left(1 - \frac{y_1}{y_2}\right)$$

will induce

$$D_i f = sf D_i - \frac{f - sf}{1 - \frac{e_{i+1}}{e_i}}$$

In 2.2.13, Another definition is mentioned:

<https://pages.uoregon.edu/ddugger/kgeom.pdf>

p75:

<https://www.sciencedirect.com/science/article/pii/S0022404994900884>

22404994900884

It's also the definition in [Ginzburg, Cor 5.11.3]

reasons for each possibility

1.15: <https://arxiv.org/pdf/math/0309168.pdf>

p50: <https://link.springer.com/content/pdf/10.1007/b10326.pdf>

p93: <http://sporadic.stanford.edu/bump/math263/hecke.pdf>

p3: <https://arxiv.org/pdf/math/0405333.pdf> is not correct

**Definition 7.33.** Let  $NH_m$  denote the NilHecke ring, i.e., the unital ring of endomorphisms of  $k[y(1), \dots, y(m)]$  generated by multiplication with  $y(1), \dots, y(m)$  and Demazure operators

$$\partial_l(f) = \frac{f - s_l f}{y(l) - y(l+1)}, \quad \partial_l(fg) = \frac{fg - s_l(fg)}{y_l - y_{l+1}} = \partial_l f \cdot g + f \cdot \partial_l g$$

for  $1 \leq l \leq m-1$ , where  $s_l$  is the transposition switching  $y(l)$  and  $y(l+1)$ . The endomorphisms which act by multiplication with  $y(1), \dots, y(m)$  generate a subring which is canonically isomorphic to  $k[y(1), \dots, y(m)]$ . Moreover, it is well-known that the ring of endomorphisms which act by multiplication by a symmetric polynomial equals the centre of  $NH_m$ .

**Lemma 11.14.** Let  $\partial_{\bar{y}, l}$  denote the Demazure operator

$$\partial_{\bar{y}, l} : f \mapsto \frac{f - s_l(f)}{x_{\bar{y}}(l+1) - x_{\bar{y}}(l)},$$

Not compatible!

Reason: euler class is about cotangent space, not about tangent space.

**Example 11.28** (NilHecke ring). Set  $\mathbf{I} = \{i\}$ ,  $\mathbf{H} = \emptyset$  and  $\mathbf{d} = ni$ . Then  $\mathbb{W}_{\mathbf{d}} = W_{\mathbf{d}} \cong \mathfrak{S}_n$ ,  $|Y_{\mathbf{d}}| = 1$ ,  $Y_{\mathbf{d}} = \{\bar{y}\}$ , where  $\bar{y} = (i, i, \dots, i)$ ,  $G_{\mathbf{d}} = \mathbb{G}_{\mathbf{d}} \cong \mathrm{GL}(n, \mathbb{C})$  and  $\mathrm{Rep}_{\mathbf{d}} = \{0\}$ . Moreover,  $\tilde{\mathcal{F}}_{\mathbf{d}} = \mathcal{F}_{\mathbf{d}} = \mathcal{F}_{\bar{y}}$ ,  $H_*^{G_{\mathbf{d}}}(\mathcal{F}_{\bar{y}}) = k[x_{\bar{y}}(1), \dots, x_{\bar{y}}(n)]$  and  $\mathcal{Z}_{\mathbf{d}} = \mathcal{F}_{\bar{y}} \times \mathcal{F}_{\bar{y}}$ . Since for each  $s_l \in \Pi$ , we have  $s_l(\bar{y}) = \bar{y}$ , the elements  $\sigma_{\bar{y}}(l)$  always act as Demazure operators. Hence  $H_*^{G_{\mathbf{d}}}(\mathcal{Z}_{\mathbf{d}})$  is the ring of endomorphisms of  $k[x_{\bar{y}}(1), \dots, x_{\bar{y}}(n)]$  generated by endomorphisms  $\sigma_{\bar{y}}(l)$  which act by multiplication with  $x_{\bar{y}}(l)$  and Demazure operators  $\sigma_{\bar{y}}(l)$ . Therefore

$$H_*^{G_{\mathbf{d}}}(\mathcal{Z}_{\mathbf{d}}) \cong NH_n.$$

$$\mathrm{Ind}_T^{P_s}(e^\lambda) = \frac{e^\lambda - e^{s \cdot \lambda}}{1 - e^{-\alpha_s}} = \frac{e^{\lambda + \alpha_s/2} - e^{s(\lambda) - \alpha_s/2}}{e^{\alpha_s/2} - e^{-\alpha_s/2}}$$

This is quite confusing.

$$\frac{e^\lambda - e^{s(\lambda)}}{1 - e^{-\alpha_s}} = \frac{e^{\alpha_s/2}}{e^{\alpha_s/2}} \frac{e^\lambda - e^{s(\lambda)}}{1 - e^{-\alpha_s}} = \frac{e^{\lambda + \alpha_s/2} - e^{s(\lambda) + \alpha_s/2}}{e^{\alpha_s/2} - e^{-\alpha_s/2}}$$
