Eine Woche, ein Beispiel

11.26 calculation of $\mathrm{Perv}_\Lambda(\mathbb{C}\mathbb{P}^1)$

Final goal: Fill in the tables in the next page.

(for first time, remove the $i^!$ column)

We won't show the following fact in this document:

<u>Fact</u> There are exactly 5 indec reps in $\mathrm{Perv}_\Lambda(\mathbb{C}\mathbb{P}^1)$.

big tilting sheaf

$P(\phi) = I(\phi)$

Hint for calculation

1. Stalk are usually easy to compute,
   while global sections are collections of compatible stalks.
2. Use some triangles can facilitate calculations.

e.g.

$$\begin{array}{ccccccc} R^0 j_* \underline{\mathbb{Q}}_{\mathbb{C}} & \longrightarrow & Rj_* \underline{\mathbb{Q}}_{\mathbb{C}} & \longrightarrow & R^1 j_* \underline{\mathbb{Q}}_{\mathbb{C}}[-1] & \xrightarrow{+1} & \\ \| & & & & \| & & \\ \underline{\mathbb{Q}}_{\mathbb{CP}^1} & & & & i_* \underline{\mathbb{Q}}_{\{\infty\}}[-1] & & \end{array}$$

$$\begin{array}{ccccccccc} 0 & \longrightarrow & j_! j^! \mathcal{F} & \longrightarrow & \mathcal{F} & \longrightarrow & i_* i^* \mathcal{F} & \longrightarrow & 0 \\ 0 & \longrightarrow & j_! \underline{\mathbb{Q}}_{\mathbb{C}} & \longrightarrow & \underline{\mathbb{Q}}_{\mathbb{CP}^1} & \longrightarrow & i_* \underline{\mathbb{Q}}_{\{\infty\}} & \longrightarrow & 0 \end{array}$$

$$\begin{array}{ccccccc} i_! i^! \mathcal{F} & \longrightarrow & \mathcal{F} & \longrightarrow & Rj_* j^* \mathcal{F} & \xrightarrow{+1} & \\ i_! \underline{\mathbb{Q}}_{\{\infty\}}[-2] & \longrightarrow & \underline{\mathbb{Q}}_{\mathbb{CP}^1} & \longrightarrow & Rj_* \underline{\mathbb{Q}}_{\mathbb{C}} & \xrightarrow{+1} & \end{array}$$

3. Open-closed formalism also save some time.

e.g. $(j_! \underline{\mathbb{Q}}_{\mathbb{C}})_\infty = i^* j_! \underline{\mathbb{Q}}_{\mathbb{C}} = 0$

Ex. Check the following table for $\mathcal{F} \in \mathcal{D}_\Lambda(\mathbb{CP}^1)$ or $PSh_\Lambda(\mathbb{CP}^1)$:

$\Lambda: \emptyset \subseteq \{\infty\} \subseteq \mathbb{CP}^1$

$\mathcal{F}$	$\mathcal{F}_0 \cong \mathcal{F}(\mathbb{C})$	$\mathcal{F}_\infty \cong \mathcal{F}(\mathbb{CP}^1 - \{0\})$	$\mathcal{F}(\mathbb{CP}^1)$	$R\Gamma(\mathcal{F})$	
$i_* \underline{\mathbb{Q}}_{\{\infty\}}$	0	$\mathbb{Q}$	$\mathbb{Q}$	$\mathbb{Q}$	
$\underline{\mathbb{Q}}_{\mathbb{CP}^1}$	$\mathbb{Q}$	$\mathbb{Q}$	$\mathbb{Q}$	$\mathbb{Q} \oplus \mathbb{Q}[-2]$	
$Rj_* \underline{\mathbb{Q}}_{\mathbb{C}}$	$\mathbb{Q}$	$\mathbb{Q} \oplus \mathbb{Q}[-1]$	—	$\mathbb{Q}$	
$j_! \underline{\mathbb{Q}}_{\mathbb{C}}$	$\mathbb{Q}$	0	$\mathbb{Q}$	$\mathbb{Q}[-2]$	
$(R^0 j_* \underline{\mathbb{Q}}_{\mathbb{C}})^{pre} = R^0 j_* \underline{\mathbb{Q}}_{\mathbb{C}}$	$\mathbb{Q}$	$\mathbb{Q}$	$\mathbb{Q}$	$\mathbb{Q} \oplus \mathbb{Q}[-2]$	$= \underline{\mathbb{Q}}_{\mathbb{CP}^1}$
$(R^1 j_* \underline{\mathbb{Q}}_{\mathbb{C}})^{pre}$	0	$\mathbb{Q}$	0	—	
$R^1 j_* \underline{\mathbb{Q}}_{\mathbb{C}}$	0	$\mathbb{Q}$	$\mathbb{Q}$	$\mathbb{Q}$	$= i_* \underline{\mathbb{Q}}_{\{\infty\}}$
$(j_! \underline{\mathbb{Q}}_{\mathbb{C}})^{pre}$	$\mathbb{Q}$	0	0	—	

How to compute $f^!$?

https://math.stackexchange.com/questions/2167554/how-to-calculate-ri

We do it by cases.

① When $f = j : U \overset{\text{open}}{\hookrightarrow} X$, $j^! = j^*$;

② When $f = i : Z \overset{\text{closed}}{\hookrightarrow} X$, use the triangle

$$
\begin{array}{ccccccc}
i_! i^! \mathcal{F} & \longrightarrow & \mathcal{F} & \longrightarrow & Rj_* j^* \mathcal{F} & \xrightarrow{+1} & \\
i^! \mathcal{F} & \longrightarrow & i^* \mathcal{F} & \longrightarrow & i^* Rj_* j^* \mathcal{F} & \xrightarrow{+1} &
\end{array}
$$

So $\quad i^! \mathcal{F} = \mathrm{Fiber}(i^* \mathcal{F} \longrightarrow i^* Rj_* j^* \mathcal{F})$.

e.p. costalks can be computed in this way, and

$$i_x^! \mathcal{F} = \varinjlim_{x \in V} H^\cdot(V, U \cap V; \mathcal{F}|_V)$$

③ When $f = \pi : X \longrightarrow \{*\}$, X mfld of dim n, one gets

$$\pi^! \mathbb{Q} = Or_X[n]$$

④ Other cases: try to write f as composition of maps we're familiar with.

e.g. for $X \subseteq \mathbb{C}^n$ hypersurface, want $\pi_X^! \mathbb{Q}$.

use the composition $\pi_X : X \hookrightarrow \mathbb{C}^n \longrightarrow \{*\}$

Surprising: $f^!$ does not depend on the composition we choose!

reason: adjunction is unique

⑤ ramified covering and blow up

Ex. Compute $f^! \mathbb{Q}$ for the following cases.

1. $f : [0,1) \longrightarrow \{*\}$
2. $f : M \longrightarrow \{*\}$ $\quad$ M: mfld with boundary
3. $f : \mathbb{C} \cup_{\{0\}} \mathbb{C} \longrightarrow \{*\}$ $\quad$ $\{x^2 + y^2 = 0\} \subseteq \mathbb{C}^2$  $\subseteq \mathbb{R}^3$
4. $f : \{z_1^2 + \cdots + z_n^2 = 0\} \longrightarrow \{*\}$
5. $f :$  $\longrightarrow \{*\}$
