## Eine Woche, ein Beispiel 5.4. line bundles on abelian varieties

Ref: follows [2025.04.13].

Most contents in this document can be found in [BL04, Chap 2 and Appendix B].

Goal: For 
$$A = V/\Lambda$$
, identify

$$Pic (A) = \frac{\sim}{hidden} H'(\Lambda, H^{\circ}(O_{V}^{*})) \xrightarrow{def} P(\Lambda)$$

$$algebraic \qquad argument? \qquad gp \ cohom \qquad analytic \qquad info \qquad info \qquad info \qquad info \qquad 1$$

$$\Delta_{Z}: \Lambda \times V \to C \qquad (H, \chi)$$

$$\Delta_{Z}(\lambda, v) = \chi(\lambda) \exp(\pi H(\lambda, v) + \frac{\pi}{2} H(\lambda, \lambda))$$

https://mathoverflow.net/questions/30611/relation-between-sheaf-and-group-cohomology This explains the iso between Pic(A) with gp cohom by using the spectral sequences on two functors:

$$(-)^{\pi_{i}(A)} \circ \pi_{A*}\pi_{*}\pi^{*} = \pi_{A,*}$$

I wonder if it is possible to express invariant functor as one in the six functor (like the pushforward from classifying space to one point), and argue this identity in abstract nonsense.

Thm (Appell - Humbert) [BLO4, p32]

A

where

$$NS(A) = \begin{cases} H: V \times V \longrightarrow C & | H \text{ Hermitian} \\ Im H(\Lambda \times \Lambda) \in \mathbb{Z} \end{cases}$$

$$P(\Lambda) = \begin{cases} (H, \chi) & | H \in NS(A) \\ \chi: \Lambda \longrightarrow S' \text{ semicharacter w.r.t. } H, i.e., \\ \chi(\lambda + \mu) = \chi(\lambda) \chi(\mu) \exp(\pi i \text{ Im } H(\lambda, \mu)) \end{cases}$$

$$\forall \lambda, \mu \in \Lambda$$

## 1. Cohomology of abelian varieties (Betti & Hodge)

$$\Omega := Hom_{\mathbb{C}}(V,\mathbb{C}) = H^{1,0}(A) \cong Hom_{\mathbb{R}}(V,\mathbb{R}) \quad \text{fdz}$$

$$\overline{\Omega} := Hom_{\overline{\mathbb{C}}}(V,\mathbb{C}) = H^{0,1}(A) \cong Hom_{\mathbb{R}}(V,\mathbb{R}) \quad \text{fd\bar{z}}$$

$$\Omega \oplus \overline{\Omega} = H'(A;\mathbb{C}) = Hom_{\mathbb{R}}(V,\mathbb{C})$$

Proof.

$$Hom_{\mathbb{C}}(V,\mathbb{C}) \longleftrightarrow Hom_{\mathbb{R}}(V,\mathbb{R})$$
 $\iota \longmapsto Re \iota \qquad dz = dx + idy \longmapsto dx$ 
 $k(-) - ik(i-) \longleftrightarrow k \qquad idz = -dy + idx \longmapsto -dy$ 

$$Hom_{\overline{c}}(V,C) \longleftrightarrow Hom_{R}(V,\overline{IR})$$

$$L \longmapsto iIm L \qquad d\overline{z} = dx - idy \longmapsto -idy$$

$$-k(i-) + ik(-) \longleftrightarrow ik \qquad id\overline{z} = dy + idx \longmapsto idx$$

$$\Omega \oplus \overline{\Omega} \longleftrightarrow Hom_{\mathbb{R}}(V,\mathbb{C})$$

$$(fdz, \overline{g} d\overline{z}) \longmapsto 7$$

$$((f,+if_2)d_{\overline{z}},0) \longmapsto f_1 dx - f_2 dy (o,(g,-ig_2)d_{\overline{z}}) \longmapsto -i(g_1 dy + g_2 dx)$$

 $f_1, f_2, g_1, g_2 \in C^{\infty}(A; \mathbb{R})$ 

Cor. 
$$H^{9}(A; \Omega_{A}^{P}) \cong \Lambda^{p} \Omega \otimes \Lambda^{9} \overline{\Omega}$$

Proof Sketch

$$H^{q}(A; \Omega_{A}^{p}) \cong H_{\overline{\delta}}^{p,q}(A)$$

$$= \delta \overline{\delta} \text{-closed } (p,q) \text{-forms on } V/\Lambda ]/\Lambda$$

$$= \delta \overline{\delta} \text{-closed } (p,q) \text{-forms on } V \text{ invariant under } \Lambda ]/\Lambda$$

$$= \delta \overline{\delta} \text{-closed } (p,q) \text{-forms on } V \text{ invariant under } V]$$

$$= \Lambda^{p} \Omega \otimes \Lambda^{q} \overline{\Omega}$$

Another proof, though essentially the same: Step 1  $\Omega_A$  is a free  $\mathcal{O}_A$ -module with rank n, so  $\Omega_A \cong \mathcal{O}_A \otimes_{\mathbb{C}} V^*$   $\Rightarrow \Omega_A^P = \Lambda^P \Omega_A = \mathcal{O}_A \otimes_{\mathbb{C}} \Lambda^P \Omega$ 

Step 2 By Dolbeault resolution, 
$$H^{9}(A; \mathcal{O}_{A}) \cong H^{9}(\mathcal{A}_{A\times \mathbb{C}}^{\circ, \prime}(A)) \cong H^{9,9}(A) \cong \Lambda^{9,\overline{\Omega}}$$

trivial 1.b. over A

Dual abelian variety

Rmk. We have canonical bilinear pairing

$$\langle -, - \rangle$$
:  $\overline{\Omega} \times \Omega^* \longrightarrow \mathbb{R}$   $\langle l, v \rangle = I_{m}(v)$ 

which restricts to

$$\langle -, - \rangle : \widehat{\Lambda} \times \Lambda \longrightarrow \mathbb{Z}$$

where

$$\Lambda := \{ l \in \overline{\Omega} \mid \langle l, \Lambda \rangle \subseteq \mathbb{Z} \}$$

$$\cong Hom_{\mathbb{Z}}(\Lambda, \mathbb{Z})$$

$$\cong H'(A, \mathbb{Z})$$

Prop. The abelian variety A and its dual A have following expressions.

$$A = \Omega^*/\Lambda = H^{\circ}(A; \Omega_A)^*/H_{\bullet}(A; \mathbb{Z})$$

$$\widehat{A} = \overline{\Omega}/\widehat{\Lambda} = H^{'}(A; \Omega_A)/H^{'}(A; \mathbb{Z})$$

$$= Pic^{\circ}(A) \cong Hom(\Lambda, S') = \{\chi\}$$

Proof. We only need to show that  $\overline{\Omega}/\widehat{\Lambda}\cong Hom_{\mathbb{Z}}(\Lambda,S')$ , which follows from applying  $Hom_{\mathbb{Z}}(\Lambda,-)$  to  $o\to\mathbb{Z}\to\mathbb{R}\to S'\to o$ .

$$0 \longrightarrow Hom_{\mathbb{Z}}(\Lambda, \mathbb{Z}) \longrightarrow Hom_{\mathbb{Z}}(\Lambda, \mathbb{R}) \longrightarrow Hom(\Lambda, S') \longrightarrow 0$$

$$||S| \\ Hom_{\mathbb{R}}(V, \mathbb{R}) \\ ||S| \\ Hom_{\mathbb{Z}}(V, \mathbb{C})$$

$$0 \longrightarrow \widehat{\Lambda} \longrightarrow \widehat{\Omega} \longrightarrow \widehat{\Omega} / \widehat{\Lambda} \longrightarrow 0$$

NS(A) more descriptions

Lemma [BLO4, Prop 2.1.6]

Let

$$NS(A) = Pic(A)/Pic^{o}_{red}(A) = H^{1}(A; \mathbb{Z}) \cap H''(A)$$
 $NS'(A) = \begin{cases} w \cdot V \times V \longrightarrow IR & w \cdot (A \times A) = \mathbb{Z} \end{cases}$ 
 $NS''(A) = \begin{cases} H \cdot V \times V \longrightarrow IR & H \cdot (A \times A) = \mathbb{Z} \end{cases}$ 
 $NS''(A) = \begin{cases} H \cdot V \times V \longrightarrow IR & H \cdot (A \times A) = \mathbb{Z} \end{cases}$ 

In  $H(A \times A) = \mathbb{Z}$ 

Timaginary part

Then

$$NS(A) \cong NS'(A) \cong NS''(A)$$
.

As a reminder, 
$$H$$
 Hermitian:  
 $H(av, bv) = \overline{ab} H(u,v) + IR$ -linear  
 $H(u, v) = \overline{H(v,u)}$   
 $Crspds$  to the matrix  $M$  s.t.  $M^H = M$   
 $H(u,v) = w(u,iv) + iw(u,v)$   
 $w(u,v) = Im H(u,v)$ 

Rmk. A Hermitian form is equiv to a C-linear map

$$\phi: \Omega^* = V \longrightarrow Hom_{\mathbb{R}}(V, \mathbb{R}) \cong Hom_{\mathbb{C}}(V, \mathbb{C}) = \overline{\Omega}$$

$$v_2 \longmapsto \omega(-, v_2) \mapsto H(-, v_2)$$

$$\varphi(iv) = H(-,iv) = iH(-,v) = i\varphi(v)$$
  
or a cplx bilinear map  $\nabla \times V \longrightarrow C$   
or an element in  $\Omega \otimes_{C} \overline{\Omega} \cong H''(A)$ 

More over,

H is non-deg 
$$\Leftrightarrow \phi$$
 is an iso  $\omega(\Lambda \times \Lambda) \subseteq \mathbb{Z} \iff \phi(\Lambda), \Lambda > \subseteq \mathbb{Z} \iff \phi(\Lambda) \subseteq \widehat{\Lambda}$ 

Therefore, 
$$NS'(A) = \{ \phi \in Hom(\Omega^*, \overline{\Omega}) \mid \phi(\Lambda) \subset \widehat{\Lambda} \}$$
  
=  $Hom(\Omega^*/\Delta, \overline{\Omega}/\widehat{\Lambda})$   
=  $Hom(A, \widehat{A})$ .

This explains why some references would like to call a morphism

(induced by an ample L.b.) as the polarization of A.

From 
$$\phi: \Omega^* \to \overline{\Omega}$$
 to  $H(-,-)$ .  
In fact, once we fixed the C-linear map  $\phi: \Omega^* \to \overline{\Omega}$ , the Hermitian from comes from the canonical bilinear pairing:
$$\langle -, - \rangle: \overline{\Omega} \times \Omega^* \longrightarrow |R \qquad \langle 1, v \rangle = Im((v))$$

$$\uparrow (\phi, Id)$$

$$w(-, -): \Omega^* \times \Omega^* \longrightarrow |R \qquad w(v_1, v_2) = Im H(v_1, v_2)$$

Hint for the main lemma. Consider the ambient spaces.

## 2. Miscellaneous

I will collect some basic results as well as its proofs here for my personal reference. They show the strategy to work with these line bundles, dual varieties stuff, but not the most important thing to put in the main goal. Maybe someday I will move them to better places.

Prop. (dual variety with SES) [BL04, Prop 2.4.2]

If

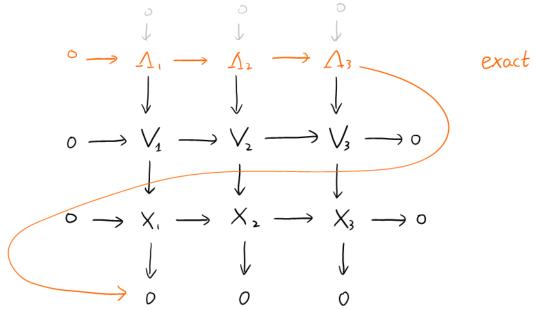

$$0 \longrightarrow X_1 \longrightarrow X_2 \longrightarrow X_3 \longrightarrow 0$$

is a SES of cplx tori, then

 $0 \longleftarrow \hat{X}_1 \longleftarrow \hat{X}_2 \longleftarrow \hat{X}_3 \longleftarrow 0$ 

is exact.

Proof. Let 
$$X_i = V_i/\Delta_i$$
, then

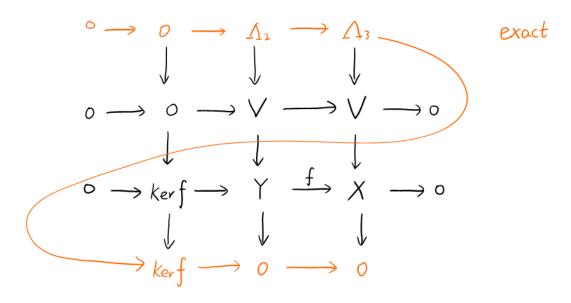

Taking Hom (-, S'),

$$0 \leftarrow Hom_{\mathbb{Z}}(\Lambda_{1},S') \leftarrow Hom_{\mathbb{Z}}(\Lambda_{2},S') \leftarrow Hom_{\mathbb{Z}}(\Lambda_{3},S') \leftarrow 0$$

is exact, i.e., 
$$\hat{\chi}_1 \leftarrow \hat{\chi}_2 \leftarrow \hat{\chi}_3 \leftarrow 0$$
 is exact.

Prop. (dual variety with isogeny) [BL04, Prop. 2.4.3] If 
$$f: Y \longrightarrow X$$
 is an isogeny of cplx tori, then  $f: \widehat{X} \to \widehat{Y}$  is an isogeny of cplx tori, with  $\ker \widehat{f} = \operatorname{Hom}(\ker f, S')$ .

Proof. Let  $Y = V/\Lambda_2$ ,  $X = V/\Lambda_3$ , then

Taking Hom (-, S'),

$$0 \leftarrow Hom(\Lambda_2,S') \stackrel{\widehat{f}}{\leftarrow} Hom(\Lambda_3,S') \leftarrow Hom(kerf,S') \leftarrow 0$$

so  $\ker \hat{f} = Hom(\ker f, S')$ .

Prop (dual variety with pa & pr) [BLO4, Ex. 2.6.(13)]
For p. Y -> X morphism between abelian varieties,

$$\rho_{a}(\hat{f}) = \rho_{a}(f)^{H}$$

$$\rho_{r}(\hat{f}) = \rho_{r}(f)^{T}$$

Hint.

$$\overline{\Omega} = Hom_{\overline{c}}(V, \mathbb{C})$$

$$\widehat{\Lambda} = Hom_{\overline{z}}(\Lambda, \mathbb{Z})$$

Prop (Image of f\* via isogeny) [BLO4, Cor 2.44]

Let  $f: X_i \longrightarrow X_i$  be an isogeny of cplx tori,  $X_i = V/\Lambda_i$ . For  $L = L(H, X) \in Pic(X_i)$ ,

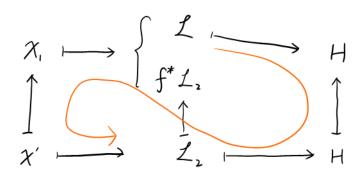

imaginary part
$$\mathcal{L} = f^* \mathcal{M} \qquad \iff \text{Im } H\left(\Lambda_2 \times \Lambda_2\right) \subseteq \mathbb{Z}$$
for some  $\mathcal{M} \in \text{Pic}\left(X_2\right)$ 

Proof. Diagram chasing. Find H' and  $\chi'$ .

$$0 \longrightarrow Pic^{\circ}(X_{1}) \longrightarrow Pic(X_{1}) \longrightarrow NS(X_{1}) \longrightarrow 0$$

$$\uparrow \qquad \uparrow \qquad \uparrow \qquad \uparrow$$

$$0 \longrightarrow Pic^{\circ}(X_{2}) \longrightarrow Pic(X_{2}) \longrightarrow NS(X_{2}) \longrightarrow 0$$

Prop. (line bundles under pullbacks) [BLO4, Lemma 23.2 & Lemma 23.4]

For 
$$Z = Z(H, \chi) \in Pic(A)$$
 and  $[v] \in A$   
 $f: A \to A$  homo of cplx tori,

$$0 \qquad \mathsf{t}_{[\nu]}^* \mathcal{L}(\mathsf{H}, \chi) = \mathcal{L}(\mathsf{H}, \chi \exp(2\pi i \mathsf{Im} \mathsf{H}(-, \nu)))$$

Prop. (c,(L) in terms of basis) [BL04,  $E_{\times, 2.6.(2)}$ ]

Suppose  $A = V/\Lambda$  of dim n,  $\mathcal{L} = \mathcal{L}(H, \chi) \in Pic(A)$  of type  $(d_1, ..., d_n)$ .

- 1) For  $V = \langle e_1, \dots, e_n \rangle_{\mathbb{C}}, \qquad z = \sum z_i e_i,$   $c_i(I) = \frac{1}{2} \sum_{\nu, \mu=1}^{n} H(e_{\nu}, e_{\mu}) dz_{\nu} \wedge d\overline{z}_{\mu}$
- 2) For  $\Delta = \langle \lambda_1, \dots, \lambda_n, \mu_1, \dots, \mu_n \rangle_{\mathbb{Z}}$  Sympletic basis for  $\mathbb{Z}$   $C_1(\mathbb{Z}) = -\sum_{\nu=1}^{n} d_{\nu} \cdot dx_{\nu} \wedge dy_{\nu}$

Cor (equiv def of polarization) the diagram commutes:

Proof. Write 1 = 1(H, x), then

$$t_{[v]}^* \angle \otimes \angle^{-1} = \angle (H, \chi_{exp}(z\pi_i \operatorname{Im} H(-, v))) \otimes \angle (H, \chi)^{-1}$$
  
=  $\angle (0, \exp(z\pi_i \operatorname{Im} H(-, v)))$   
=  $\pi_{\bar{s}} \circ \phi_H(v)$ 

Prof & Def (Kernel of polarization) [BLO4, Prop 2.49]

Let L & Pic(A) ample, then

$$0 \longrightarrow \Lambda(L)/\Lambda \longrightarrow \Omega^*/\Lambda \xrightarrow{\overline{\phi}_H} \overline{\Omega}/\Lambda \longrightarrow 0$$

$$\parallel \qquad \qquad \parallel \qquad \qquad \parallel$$

$$0 \longrightarrow Ker \phi_L \longrightarrow A \xrightarrow{\phi_L} \widehat{\Lambda} \longrightarrow 0$$

$$\parallel \text{odef}$$

$$K(L)$$

Where

$$\Delta(L) = \phi_H^{-1}(\widehat{\Delta}) = \{ v \in V \mid I_m \vdash H(\Delta, v) \subseteq \mathbb{Z} \}.$$

When # Ker  $\phi_{\ell} < +\infty$ ,

$$deg \phi_{\mathcal{L}} = \# \text{Ker } \phi_{\mathcal{L}} = [\Delta(L) : \Delta] = \text{det}(T_m H)$$
.

Prop. (analytic construction of Poincaré bundle)

We have a l.b.  $P \in Pic(A \times \widehat{A})$  s.t.

i) 
$$P_{A\times R} \cong L$$
  
ii)  $P_{R} \times A \cong OA$ 

Hint. We define P = P(H, x), where

$$H_{\cdot}(V \times \overline{\Omega}) \times (V \times \overline{\Omega}) \longrightarrow \mathbb{C} \qquad H((v_{\cdot}, l_{\cdot}), (v_{\cdot}, l_{\cdot})) = \overline{l_{2}(v_{\cdot})} + l_{1}(v_{\cdot})$$
  
 $\chi_{\cdot} \qquad \Lambda \times \Lambda \qquad \longrightarrow S' \qquad \chi(\lambda, l_{0}) = \exp(\pi i \operatorname{Im} l_{0}(\lambda))$ 

For  $L = \mathcal{L}(0, \exp(2\pi i \operatorname{Im} L(-1)))$  ( $\in \overline{\Omega}$ , need to check i) ii).

Prop. (PA with duality & polarization) [BLO4, Ex. 2.6, (16) (17) & Lemma 14.1.1]

Denote 
$$S: \hat{A} \times A \longrightarrow A \times \hat{A} \qquad (l, v) \longmapsto (v, l)$$

$$A \times \hat{A} \longrightarrow \hat{A} \longrightarrow \hat{A} \times \hat{A} \longrightarrow \hat{$$

we have

$$S^* P_A \cong (Id_A \times k)^* P_{\widehat{A}}$$
  
 $p_{P_A}^* P_{\widehat{A}} \cong P_A$   
 $(Id_A, p_I)^* P_A \cong \mu^* I \otimes p_I^* I^{-1} \otimes p_I^* I^{-1}$ 

As a result,

$$\mathcal{L} \in \operatorname{Pic}^{\circ}(A) \iff \phi_{\mathcal{L}} = \mathfrak{f} * \mathbb{I}$$

$$\iff H = 0$$

$$\iff (\operatorname{Id}_{A}, \phi_{\mathcal{L}})^{*} \mathcal{P}_{A} = \mathcal{O}_{A \times A}$$

$$\iff \mu^{*} \mathcal{L} \cong p^{*} \mathcal{I} \otimes p_{i}^{*} \mathcal{I}.$$
