## Eine Woche, ein Beispiel 430 TVS = topological vector space

Ref:

Lec 1-7: http://staff.ustc.edu.cn/~wangzuoq/Courses/15F-FA/index.html

In this document, we don't worry about extra structure here, and we assume Hausdorff.

## 7: exists a metric

Rmk. There are two definitions of boundedness in metrizable TVS X, and they coincide if the metric is translation-invariant.

Def. (boundness for TVS)  $E \subset X \text{ is bounded if } \forall o \in U \text{ open, } \exists s > 0 \text{ s.t.}$   $\forall t > s , \quad E \subset tU$ 

In this case,

E is bounded  $\Leftrightarrow$   $\begin{bmatrix} \forall \{x_n\} \subset E, \{a_n\} \subseteq \mathbb{R} \text{ or } \mathbb{C}, \\ a_n \to 0 \Rightarrow a_n x_n \to 0 \end{bmatrix}$ 

Def. (boundness for metric space)

Fix  $x_0 \in X$ . boundness does not depend on  $x_0$ .  $E \subset X$  is bounded if  $\exists r > 0$ ,  $E \subset B_{x_0}(r)$ .

Rmk 1 For loc convex TVS with metric, all open balls are convex. 2 cpl metric space  $\Rightarrow$  2<sup>nd</sup> category
