Ref of table: Berkeley notes

Rmk. Max Spec A has only a Grothen dieck topology.

K (in K-affinoid space) is a NA field, but can also be generalized to K-Bonach alg.

Description of the control of the

1.3. Def (seminorm of A-module, where A normed ring)
          seminorm group t 3 (>0, ||fm|| < C||f|| ||m||
                   . ⊗₄
    Arch field non-Arch field (IR, | l_{\infty}) (IR/C, | l_{\infty}^{e}) (IF_q, triv) (K, triv) (C, | l_{\infty}) (Q_p, | \cdot | p)
```

(€,| l∞)

V In analysis, the word "seminorm" is defined in a "totally" different way: Definition 1.1.3. A seminorm on a  $\mathbb{K}$ -vector space E is a function  $p:E\to\mathbb{R}$  such that

(1)  $p(x+y) \le p(x) + p(y)$  for all  $x, y \in E$ .

(2)  $p(\lambda x) = |\lambda| p(x)$  for all  $\lambda \in \mathbb{K}$ ,  $x \in E$ .

In analysis, the ring usually has no unit (eg.  $L'(\mathbb{R})$ ), and (semi) norms are absolute homogeneous. Moreover, we don't require semimultiplicative. e.g. in  $L^p(\mathbb{R})$ , one don't have  $\|fg\|_p \leq \|f\|_p \|g\|_p$ 

Apart from analysis, the terminology is concluded as follows.

Seminorm						
(multiplicative) norm = absolute value = places						
valuation (Bourbaki) exponential valuation NA absolute value ultrametric absolute value	Archi absolute value					

I prefer Bourbaki's terminology, because valuations are always written additive, and the natural triangular inequality is the ultrametric inequality, i.e.,  $\nu(a+b) \ge \min(\nu(a), \nu(b))$ , with equality if  $\nu(a) \ne \nu(b)$ . Many people don't use "absolute value" for high rank valuations.

In the main ref (as well as this document, e.g. no example found yet) the norm can be not multiplicative, but I assume norm to be multiplicative in other documents.

2. Affine cose suppose A. Banach ring comm +1 M(A) = ? bounded mult seminorms on A? with top basis generated by Um, (a,b) = \\ IIII € M(A) | IIMI € (a,b) } MEA, (a,b) EIR M (A/(Z,110)) = 5 mult seminorms on A} E.g. A = (Z, 1 la) Don't confuse with l-lp=1-12p in functional analysis! We have  $\mathcal{M}(\mathbb{Z}, | \mathbb{I}_{\infty}) = \begin{cases} ||\mathbf{1}_{\text{triv}}| = \text{trivial norm} \\ ||\mathbf{1}_{p}| : \mathbf{1} \in (0, +\infty] \\ ||\mathbf{1}_{p}| : \mathbf{1} \in (0, +\infty] \end{cases} ||\mathbf{1}_{p}||_{\mathbb{F}_{p}} = ||\mathbf{1}_{p}||_{\mathbb{F}_$ Picture: 1 leriv  $\|\cdot\|_{F_{tt}}$ 1 1F2 1 1F2 11/15 From this picture, we want to get: value of Bound relations among seminorms Topology properties: Hausdorff? compact? Residue field, injection and contraction ... See next page Rmk. When we do not identify the norm we mean A/a, 1 w. E.g. A = (Q., 11-11 any), M(A)= {\*} E.q. A = (|Fq, || || || M (|Fq) = {\*} E.g. A = IR/C continuous seminorms are  $II II_{\infty}^{\varepsilon}$ ,  $\varepsilon \in [0,1]$ . Do we have any other cont seminorms? No. continuous seminorms are  $\|\cdot\|_p^t$ ,  $t \in [0,+\infty]$ . (A=Qp is also interesting) E.g. A = Zp Do we have any other cont seminorms? E.g. A = Cp If we only consider the norm which restricted to Cis I la, Eq. A = C[x] we would get C. Need to verify... What would happen in the other cases? If we only consider the norm which restricted to Cis I livin, we would get CIP' Eq. A = Cp<r-T> or 1P'c.

E.g. A = (Z[i], || ||ω)

I'm very happy to dv the homework one years ago. E.g. A = (Z, 110) Try to answer the following questions - Set · M(Z) = \ · Archi or non Archi? · partial order ~> bound order · Picture V max: 11:11/160
maximal/minimal Seminorm min 11:11/160 · Berkovich Structure of 11.11 ∈ M(Z) ? (M(Z), gragh) - Topo not contain Iltriv: normal way + contain only finite 11.11pt contain litrive normal way not contain litrive normal way · Close set · Open set contain 11this, normal way + contain all IIIIp except finite p (M(Z), weak) is continuous · Topo properties: connected? Hausdorff? (quasi) compact? weak top is a little weaker

> Def.  $\mu \in X$  is a closed pt iff  $\beta \beta$  is closed Then every  $\mu \in X$  is closed  $\mu \in X$
